

VETERINARIAN'S DOG IMPORTATION CHECKLIST

Points to discuss before or after a client imports a dog(s) into Canada

Before a decision is made to import:

- Imported dogs may carry diseases, which are uncommon or exotic to Canada.
 - o These diseases may be transmissible to other animals and/or people (i.e. zoonotic).
 - o Some diseases may not be curable (e.g. leishmaniasis).
- Imported dogs may have unknown and unresolvable behavioural issues.
- Transport can be lengthy and stressful and increase disease susceptibility.
- Importing dogs means less likelihood that local dogs will be adopted.

Before dogs enter Canada:

- Examination by a gualified veterinarian in the country of origin.
- Rabies vaccination (as required by the Government of Canada).
- Other core vaccinations.
- **Deworming**, including tapeworm.
- Treatment for external parasites

- (e.g. <u>fleas</u> and <u>ticks</u>).
- Heartworm testing. Tests for diseases that may be present in country of
- origin, but not present or uncommon in Canada (e.g. Leishmania in the Mediterranean basin and South America, Brucella canis in US midwest).

After dogs enter Canada:

- Quarantine dogs for 30 days (minimum 14 days) in a house or a facility away from other animals and high-risk people (e.g. young children, elderly, compromised immune systems).
- Monitor closely for signs of any illness and consult a veterinarian as needed.
- o Rabies risk may persist for up to six months.
- o Culture suspected bacterial infections due to risk of multi-drug resistant organisms.
- Examination by a veterinarian as soon as possible (even before going home).
- Repeat vaccinations or tests as needed.
- Behavioural assessment.
- Repeat heartworm test after six months.
- Spay or neuter.
- Don't forget ID with a microchip
